

11/28

- Unresolved questions:
 - Promise vs. normal code
 - Testing: “called done() too many times”, but in the code, only called done() once
- Revised Design due Wednesday
 - Mentor feedback?
- Project Revision vs Final Code Hand In
 - What’s the difference?
- Error
 - Let all errors in models propagate to controllers and send back 500 to client?
 - How specific should the error message be?
 - console.log is helpful during development but is there an easier way than commenting out/deleting for deployment?
- Live update
 - Improvement for final: don’t send checkUpdate GET req while notification is displayed (user hasn’t clicked to see new updates)
 - Better check for update?
 - Current implementation: compare count of Babble database
 - Is this an expensive query?
 - Alternative for the Comet model?
 - Implementation for the comment section
 - Problem: can’t use the current implementation for Babble on Comment without knowing which Babble is currently displayed on the page
 -

12/5

- integration of nev into user model
 - different route needed for development vs production
 - sender email
 - error message propagation to routes
 - implications in test cases
 - existing tests use register
 - also, how do we write unit tests for this...
- Currently the update of top ten happens every time we refresh the page, how can we do it so it updates every week
- When testing...while loop doesnt work, have no idea why...in anonymousNameTest the last test case is not functioning at all...something to do with done?
- babble.addComment and comment.addComment, which way should we do it
- Wednesday expectation
