After completing the project, your team will together write a reflection on the project and what you learned from it: what went well, and what could have been improved, and what you would do differently in the future.

What went well…
Teamwork: Our work styles were similar enough to not initiate problems. We would like to think that we were supportive teammates to each other, understanding of others' schedule and outside work.
Design: We were able to civilly resolve disagreements so that the design is populated with everyone's ideas. Design changes were discussed with the entire team.
Programming: Our strengths complemented each other, enabling specialization and smooth collaboration. Even though we specialized, we still took time to understand how the others were implementing to learn from each other. We often discussed implementation options before diving straight into it, which reduced bugs and merge conflicts.

What could have been improved…
Teamwork: We could have been more on time to meetings.
Design: We could have spent more time before the first design document was due to consolidate the purpose and description of our app.
Programming: We could have thought about the MVP implementation more carefully, taking future expansions into account. This would have reduced the amount of changes between MVP and final code hand-in (not just the additional code for the new features).

What we would do differently in the future…
Teamwork: Be more punctual to meetings.
Design: Take more time identifying purpose and concepts.
Programming: Write more modular code that is easy for change. Document code better. Spend more time thinking carefully.
